

EXECUTIVE SECURITY AUDIT REPORT

TO: Chief Executive Officer, Titan FinTech

FROM: Chad K. Bachoo

DATE: August 18, 2026

SUBJECT: Continuous Compliance Infrastructure Audit & Perimeter Remediation

Executive Summary

A continuous compliance audit of Titan FinTech cloud infrastructure was executed utilizing automated AWS Config recorders to map environment configurations against regulatory blueprints and frameworks. The deployment successfully identified critical perimeter vulnerabilities, establishing an active security baseline and immediate isolation-based remediation actions to protect enterprise market equity.

Findings & Business Risk Analysis

During the automated discovery lifecycle, two severe structural configuration drifts were evaluated:

- **Unrestricted Administrative Ingress (restricted-ssh violation):** A critical production firewall ruleset was detected exposing management port 22 (SSH) to the entire public internet (0.0.0.0/0). **Business Risk:** This exposure bypasses baseline access paths, subjecting core financial processing zones to aggressive brute-force entry, credential hijacking, and ransomware delivery vectors that threaten operational transaction continuity.
- **Public Data Storage Exposure (s3-bucket-public-read-prohibited baseline):** The cloud configuration scanned infrastructure definitions allowing unauthenticated public read data access on object containers. **Business Risk:** While root account-level blocks checked this exposure in the active sandbox, configuration drift of this tier creates severe legal liability, systemic data leaks, and substantial regulatory non-compliance fines.

Remediation Architecture & NIST CSF Alignment

Immediate incident response containment and environment engineering actions were conducted to secure the cloud boundary. Operations were structured strictly under the core functions of the NIST Cybersecurity Framework (CSF 2.0):

1. **Identify (ID.RM):** Mapped technical data storage assets and network entry points to determine compliance coverage gaps.
2. **Detect (DE.CM):** Deployed automated AWS Config continuous monitoring recorders to flag unauthorized configuration drift in real time.
3. **Protect (PR.AC):** Surgically deleted the unrestricted ingress boundary rule from the firewall matrix and enforced global S3 block access.

Conclusion

Titan FinTech core cloud boundaries have been fully returned to a verifiable green, compliant state. Moving forward, our automated alerting infrastructure will maintain persistent monitoring, ensuring complete defensive resilience against unauthorized resource mutations and privilege drift.
